NO. 5

SICKNESS AMONG MALE INDUSTRIAL EMPLOYEES DURING THE THIRD QUARTER AND THE FIRST 9 MONTHS OF 1935 1

By Dean K. Brundage, Statistician, Office of Industrial Hygiene and Sanitation, United States Public Health Service

The rise in sickness incidence which was recorded for a group of 159,000 male industrial employees in the second quarter of 1935 did not extend into the third quarter of the year. For the 9 months as a whole (January to September, inclusive), however, the frequency of cases of illness causing disability for 8 consecutive calendar days or longer was higher than in the same period of 1934. It appears that a larger number of 8-day or longer disabilities per 1,000 men will be recorded for the year 1935 than occurred in 1934.

The chief reason for the higher disability rate in 1935 is to be found in an increased frequency of respiratory diseases. For each of the respiratory-disease categories listed in table 1, a higher rate is shown for the first 9 months of 1935 than for the corresponding period of 1934. Most marked was the increase in the incidence of influenza, the annual rate being 13.9 cases per 1,000 men during the first 9 months of 1935 as compared with 9.4 during the same period of the preceding year. That the influenza experience of the group of industrial workers under consideration was representative of the general experience among employed persons throughout the country is indicated by the statistics of influenza mortality for the many millions of wage-earners and their dependents who are insured in the industrial department of the Metropolitan Life Insurance Co. Mortality from influenza, according to the Metropolitan Co.'s records, was greater during the first 9 months of 1935 than in the same period of 1934. The company reports, however, that the excess was not marked, and has decreased as the year has progressed.2

³ Statistical Bulletin, Metropolitan Life Insurance Co., vol. 16, no. 10, October 1935, p. 4.

¹ The report for the second quarter and the first half of 1937 was published in the Public Health Reports for Nov. 15, 1935, vol. 50, no. 46, pp. 1607-1610.

TABLE 1.—Frequency of disability lasting 8 calendar days or longer in the third quarter and in the first 9 months of 1935 compared with the corresponding periods of 1934 (male morbidity experience of industrial companies which reported their cases to the U. S. Public Health Service)

Average number of males covered in the record		157, 771	151, 805	158, 576 33	154, 125	

¹ In 1934 and 1935 the same companies are included. The rates for the third quarter of the years 1930-34 include 22 of these companies, which employed an average of 123,806 men during these months, or 82 percent of the 151,805 men representing the sample population for the 5-year average.

¹ Exclusive of disability from venereal diseases and a few numerically unimportant causes of disability.

For nonrespiratory diseases as a whole the incidence rate was almost the same in each of the periods under review. However, a small increase is shown both in the third quarter and in the first 9 months of 1935 in the frequency of diseases of the circulatory and of the genito-urinary systems. The prevalence of epidemic and endemic diseases exclusive of influenza also appears to have been somewhat greater in the first 9 months of 1935 than in the same period of the year before. However, a reduced incidence is shown in digestive diseases as a whole, and an appreciable decrease in the frequency of

nonindustrial accidents occurred in the third quarter and in the first 9 months of 1935 as compared with corresponding periods of 1934.

In general, the morbidity rates are indicative of relatively good health conditions during the first three quarters of 1935. Although the frequency of disabling sickness was somewhat greater than in 1934, the rate was below the average for the preceding 5 years. Brilliant results in comparison with those of the preceding year are not to be expected, because in 1933 and 1934 unusually low sickness incidence rates were recorded for the sample of the industrial population under consideration.

The sickness rates presented here are based on reports of cases causing disability for more than 1 week and for which cash benefits are paid from funds to which the employee, the employer, or both contribute. The venereal diseases and a few numerically unimportant causes of disability are not included.

The comparison of disability rates in 1935 with those in 1934 is based on the reports of identical companies, 32 in number, and the 5-year averages are based on the experience of almost the same employee groups. The reporting companies employ men in almost all parts of the country; however, a majority of the workers covered in the record live north of the Ohio and east of the Mississippi River.

DEATHS DURING WEEK ENDED JAN. 11, 1936

WEEKLY REPORTS FROM CITIES

City reports for week ended Jan. 11, 1936

This table summarizes the reports received weekly from a selected list of 140 cities for the purpose of showing a cross section of the current urban incidence of the communicable diseases listed in the table. Weekly reports are received from about 700 cities, from which the data are tabulated and filed for reference.
